

Complete Multidirectional Communications System Dedicated to Safety

- Instantly send and receive alerts on your phone
- Emergency broadcast to all users
- Multidirectional group messaging provides full communication between users, security, responders, staff and administrators
- Users can provide firsthand onsite information
- Security systems can send alarm notifications
- User location and room status shows where people are, and if they need help
- Control Center website to coordinate response
- Private Safety Network for Android and iPhone was thoroughly evaluated and approved by FirstNet®

Private Safety Network™ in Every Pocket Can Save Lives!

Private Safety Network (PSN) gives organizations, schools, municipalities and the people in them the ability to communicate in real time. People can swiftly report what they see to onsite PSN user groups who can react immediately. Additionally they can communicate with responders, giving them complete, accurate, timely data directly from the site. Responders and administrators are able to send mass notifications, giving people fast, valuable information that can keep them safe.

PSN also uses data from devices, and includes it in the communications. Users' locations, room status, access control and security system events are all made available almost instantly to the people who need them. This is the vision of PSN, connecting people who are at risk with people who can provide help, and giving those responders all of the available information about the situation. Instead of this information being routed through a central dispatch that may be quite distant and overwhelmed, it is sent directly to the people who need it. ***We are aware of no other system that provides responders with onsite data from people and devices at the speed of PSN.***

Control Center Website

PSN includes a control center website which can act as a command and control center during a crisis. In calmer times the administrative website provides user maintenance functions.

- Today's messages are seen in real-time, so administrators have current information.
- Replies can be directed to individuals, groups, or the entire network. This allows administrators to provide instructions and information to targeted groups.
- User group management. Add and edit groups and their users.
- Approve/disapprove new member requests. Edit user contact information, Delete expired users.
- Manage roles and permissions for groups.
- Search and view archived messages. Postmortems of emergencies can be conducted.

Security System/Access Control Integration

Security Systems

- Alarms for forced doors, intruders, invalid scans, etc., create PSN message threads to groups that you select
- Notifications from the security system are received nearly immediately
- Recipients can use PSN to coordinate responses, and provide information to everyone involved

Access Control Systems

- Data from ID card scanning and smart locks provide user locations
- Names, locations, and head counts are based on real-time knowledge and are sent to Room Status Reports
