

FirstNet Push-to-Talk: Dispatch Integration

Overview

FirstNet Push-to-Talk (FNPTT), part of our mission critical group communication platform for FirstNet subscribers, is now accessible to dispatchers needing to manage FNPTT users along with their land mobile radio (LMR) users.

Public safety and public service organizations use dispatch console systems as their “command and control” platform to manage and coordinate their communication operations including PTT talk groups, 911 telephony, computer-aided dispatch, mapping resources, logging recorders and other critical systems.

Specifically designed for customers using the Catalyst Propulsion™ console, our FNPTT dispatch solution allows Propulsion users to better manage all PTT resources and enables the following:

- **Multi-session PTT conversations.** Dispatchers can join simultaneous FNPTT sessions (up to 100 conversations).
- **Priority dispatch calling-override.** Dispatchers gain priority access and floor control on the FirstNet PTT service.
- **Interconnect FNPTT and LMR subscribers.** Supports interoperability between existing LMR, FNPTT and other broadband PTT talk groups, via available console patching features.
